

KNearestNeighbors Project

June 10, 2018

1 K Nearest Neighbors Project

A very simple K Nearest Neighbors Project. ## Import Libraries

```
In [1]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
%matplotlib inline
```

1.1 Get the Data

```
In [2]: df = pd.read_csv('KNN_Project_Data')
```

Check the head of the dataframe.

```
In [23]: df.head()
```

```
Out [23]:
```

	XVPM	GWYH	TRAT	TLLZ	IGGA	\
0	1636.670614	817.988525	2565.995189	358.347163	550.417491	
1	1013.402760	577.587332	2644.141273	280.428203	1161.873391	
2	1300.035501	820.518697	2025.854469	525.562292	922.206261	
3	1059.347542	1066.866418	612.000041	480.827789	419.467495	
4	1018.340526	1313.679056	950.622661	724.742174	843.065903	

	HYKR	EDFS	GUUB	MGJM	JHZC	\
0	1618.870897	2147.641254	330.727893	1494.878631	845.136088	
1	2084.107872	853.404981	447.157619	1193.032521	861.081809	
2	2552.355407	818.676686	845.491492	1968.367513	1647.186291	
3	685.666983	852.867810	341.664784	1154.391368	1450.935357	
4	1370.554164	905.469453	658.118202	539.459350	1899.850792	

	TARGET CLASS
0	0
1	1
2	1
3	0
4	0

2 EDA

Since this data is artificial, we'll just do a large pairplot with seaborn.

Use seaborn on the dataframe to create a pairplot with the hue indicated by the TARGET CLASS column.

```
In [4]: sns.pairplot(df,hue='TARGET CLASS',palette='coolwarm')
```

```
Out[4]: <seaborn.axisgrid.PairGrid at 0x1197505f8>
```

3 Standardize the Variables

Time to standardize the variables.

**** Import StandardScaler from Scikit learn.****

```
In [5]: from sklearn.preprocessing import StandardScaler
```

```
** Create a StandardScaler() object called scaler.**
```

```
In [6]: scaler = StandardScaler()
```

```
** Fit scaler to the features.**
```

```
In [7]: scaler.fit(df.drop('TARGET CLASS',axis=1))
```

```
Out[7]: StandardScaler(copy=True, with_mean=True, with_std=True)
```

Use the `.transform()` method to transform the features to a scaled version.

```
In [8]: scaled_features = scaler.transform(df.drop('TARGET CLASS',axis=1))
```

Convert the scaled features to a dataframe and check the head of this dataframe to make sure the scaling worked.

```
In [9]: df_feat = pd.DataFrame(scaled_features,columns=df.columns[:-1])
df_feat.head()
```

```
Out[9]:
```

	XVPM	GWYH	TRAT	TLLZ	IGGA	HYKR	EDFS	\
0	1.568522	-0.443435	1.619808	-0.958255	-1.128481	0.138336	0.980493	
1	-0.112376	-1.056574	1.741918	-1.504220	0.640009	1.081552	-1.182663	
2	0.660647	-0.436981	0.775793	0.213394	-0.053171	2.030872	-1.240707

4	-0.099059	0.820815	-0.904346	1.609015	-0.282065	-0.365099	-1.095644	

	GUUB	MGJM	JHZC
0	-0.932794	1.008313	-1.069627
1	-0.461864	0.258321	-1.041546
2	1.149298	2.184784	0.342811
3	-0.888557	0.162310	-0.002793
4	0.391419	-1.365603	0.787762

4 Train Test Split

Use `train_test_split` to split your data into a training set and a testing set.

```
In [10]: from sklearn.model_selection import train_test_split
```

```
In [11]: X_train, X_test, y_train, y_test = train_test_split(scaled_features,df['TARGET CLASS'],
                                                             test_size=0.30)
```

5 Using KNN

Import KNeighborsClassifier from scikit learn.

```
In [12]: from sklearn.neighbors import KNeighborsClassifier
```

Create a KNN model instance with `n_neighbors=1`

```
In [13]: knn = KNeighborsClassifier(n_neighbors=1)
```

Fit this KNN model to the training data.

```
In [14]: knn.fit(X_train,y_train)
```

```
Out[14]: KNeighborsClassifier(algorithm='auto', leaf_size=30, metric='minkowski',
                             metric_params=None, n_jobs=1, n_neighbors=1, p=2,
                             weights='uniform')
```

6 Predictions and Evaluations

Let's evaluate our KNN model!

Use the `predict` method to predict values using your KNN model and `X_test`.

```
In [24]: pred = knn.predict(X_test)
```

**** Create a confusion matrix and classification report.****

```
In [16]: from sklearn.metrics import classification_report, confusion_matrix
```

```
In [17]: print(confusion_matrix(y_test,pred))
```

```
[[112  40]
 [ 34 114]]
```

```
In [18]: print(classification_report(y_test,pred))
```

	precision	recall	f1-score	support
0	0.77	0.74	0.75	152
1	0.74	0.77	0.75	148
avg / total	0.75	0.75	0.75	300

7 Choosing a K Value

Let's go ahead and use the elbow method to pick a good K Value!

****Create a for loop that trains various KNN models with different k values, then keep track of the error_rate for each of these models with a list. Refer to the lecture if you are confused on this step.****

```
In [25]: error_rate = []

# Will take some time
for i in range(1,40):

    knn = KNeighborsClassifier(n_neighbors=i)
    knn.fit(X_train,y_train)
    pred_i = knn.predict(X_test)
    error_rate.append(np.mean(pred_i != y_test))
```

Now create the following plot using the information from your for loop.

```
In [20]: plt.figure(figsize=(10,6))
plt.plot(range(1,40),error_rate,color='blue', linestyle='dashed', marker='o',
         markerfacecolor='red', markersize=10)
plt.title('Error Rate vs. K Value')
plt.xlabel('K')
plt.ylabel('Error Rate')
```

Out[20]: <matplotlib.text.Text at 0x11cbdb710>

7.1 Retrain with new K Value

Retrain your model with the best K value (up to you to decide what you want) and re-do the classification report and the confusion matrix.

```
In [21]: # NOW WITH K=30
         knn = KNeighborsClassifier(n_neighbors=30)

         knn.fit(X_train,y_train)
         pred = knn.predict(X_test)

         print('WITH K=30')
         print('\n')
         print(confusion_matrix(y_test,pred))
         print('\n')
         print(classification_report(y_test,pred))
```

WITH K=30

```
[[127  25]
 [ 23 125]]
```

	precision	recall	f1-score	support
0	0.85	0.84	0.84	152
1	0.83	0.84	0.84	148
avg / total	0.84	0.84	0.84	300
